

FRANCISCO GONZALEZ

Cleveland, OH | ffgazocar@gmail.com | 857-406-9077 | linkedin.com/in/ffgazocar

SUMMARY

Python engineer specializing in data analysis, performance optimization, and model-ready pipelines. Experienced building distributed systems, real-time visualization engines, and scalable analytical tooling that transform raw data into actionable insights.

SKILLS

- Languages: **Python, SQL, JavaScript**
 - Frameworks: **PySide6, FastAPI, Flask, Polars**, scikit-learn
 - Data: feature engineering, **ETL** pipelines, statistical analysis, predictive modeling
 - Machine Learning: regression, classification, evaluation metrics, LLM-assisted analysis
 - Performance: parallel processing, caching, throttling, real-time optimization
 - Visualization: **PyQtGraph**, data dashboards, interactive analytics interfaces
-

EXPERIENCE

Python Developer – Contract at Outlier.AI | Jun 2024 – Present

- Develop and evaluate structured data pipelines for AI model output verification using **Python** and **SQL**.
- Enhanced clarity and reproducibility of validation workflows through automated analysis scripts.
- Implemented profiling utilities to benchmark data transformations and improve feature extraction speed.

Software Developer – Contract at Cupen Systems | May 2021 – Jun 2024

- Designed modular **ETL** services transforming structured and semi-structured data for analytical use.
- Built predictive data tools leveraging **Polars** and scikit-learn for performance and insight generation.
- Created visualization and reporting modules enabling teams to identify data-driven improvement areas.

Engineer – Hybrid at USPRO | January 2020 – April 2021

- Coordinated backend process tracking, documentation, and data reliability initiatives across teams.
 - Assisted infrastructure analysis and versioning workflows to improve process traceability.
 - Dedicated and committed approach with strong communication and Agile participation.
-

PROJECTS & INTERESTS

Real-Time Python Profiler & Analytics Platform

Architected a distributed profiling and monitoring system processing 55k+ events/sec with sub-ms latency. Implemented queue-based ingestion, caching, and feature aggregation for real-time insight generation. **PySide6** dashboard visualizes metrics and trends across multiple processes. Optimized loop performance from 70 ms → <1 ms through smart throttling and workload distribution.

Modular Data Visualization & Processing Engine

Built an event-driven analytical engine supporting 25+ synchronized data views with lazy rendering. Uses **Polars** and **Parquet** for high-volume data aggregation and real-time transformation. Designed feature extraction, signal processing, and batch metrics computation pipelines enabling interpretable, actionable data insights for downstream ML tasks.

EDUCATION

B.S. in Engineering – Universidad Jose Antonio Paez (ABET) | October 2017

ADDITIONAL INFORMATION

- Authorized to work in the United States. Seeking hybrid or remote opportunities.
